                                           The sequences given in AARZ6004-19 are influenza fusion peptides, derived from the influenza virus haemaggiuthinin gene which were used for the preparation of synthetic membrane vessicles. The arrangment of at least one, pref. three cystein residues at one end of these peptides has been found useful for the fusion activity, for the fusion of the liposome to the target cell membrane. The liposomes produced using these peptides can contain at least one active drug and can be used to target cells infected with cancer
                                                                                                                                                                                                                                          Drug-contg. phospholipid bi:layer vesicle with cell-specific markers on membrane - where markers have at least 90 per cent biological activity, used as pharmaceuticals against e.g. cancer
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention relates to compositions of modified soluble protein antigens capable of eliciting an enhanced in vivo cyrotoxic T cell (CTL) response i.e. a major histocompatability complex (MHC) class I molecule response. The protein antigen is modified by the covalent addition of a peptide sequence which facilitate entry of the antigen into antigen presenting cells (APCs). The present sequence is one such peptide sequence which can be used to modify the soluble antigens. The present sequence is peptide HA. The modified antigen composition may be used for immunising against, or treating a tumour e.g. prostate and breast carcinoma or multiple myeloma, or pathogen in mammals.

                                                                             cc peptides are used as drug delivery systems, preferably for connections of the work of genetic material to target cells or tissues, cc particularly for diagnosis, treatment (especially antisense treatment) cc particularly for diagnosis, treatment (especially antisense treatment) contained to concern leukaemia and viral infections in humans or animals. Genetic material is delivered, without infection, to resting or proliferating cc cells, in vitro or in vivo. When the genetic material is an antisense cc cells, in vitro or in vivo. When the genetic molecule, it is targeted to mRNA encoding a (proto)oncogene. The cc continuous lipid layer does not leak. The peptides do not need to fuse continuous lipid layer does not leak. The peptides do not need to fuse cc with, or destabilise, plasma membranes in order to enter the cytoplasm, cc since the fusion peptide ensures cell penetration by endocytosis (after which fusion of the vesicle and endosomal membrane occurs). The genetic material thus has a greater chance of reaching the nucleus before it is degraded or expelled. Transfer of the material is 1000-20000 times more efficient than when using liposomes or conventional virosomes, so cannet conventional virosomes, so conventional virosomes, so convention to the convention of the west of the material is 1000-20000.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Query Match

                                                                                                                                                                                                                                        polypeptides. The cationic virosome is a lipid bilayer vesicle comprisis a membrane with a net positive charge and contains 5-30 weight & based total lipids, 1,3-dioleoyloxy-2-(6-carboxy-spermy)-propyl-amide (DOSPER), together with other lipids and at least one active fusogenic peptide. The fusogenic peptide is a viral haemagylutinin that causes the vesicle to be internalized by target cells through phagocytosis or endocytosis. The virosome is useful for delivering a desired drug or substance, preferably a nucleic acid, to target cells (resting or proliferating mammalian cells) such as cancer cells, leukaemic cells or virally infected cells in vitro, in diagnostic or medical applications and for the manufacture of medicament for carrying out non-infectious gene therapy
                                                                                                                                                                                                                                                                                                                                                                                                                                                  Lipid bilayer vesicle, useful for delivering drugs to target cells as cancer, leukemic, or virally infected cells, comprises viral glycoproteins in positively charged membrane.

The protein antigen is modified by the covalent addition of a peptide sequence which facilitate entry of the antigen into antigen presenting cells (APCs). The present sequence is one such peptide sequence which can be used to modify the soluble antigens. The present sequence is tandem HA/ pK peptide conjugate. The modified antigen composition may be used for immunising against, or treating a tumour e.g. prostate and breast carcinoma or multiple myeloma, or pathogen in

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             preferably 0-2. The present sequence represents a specifically claimed acidic peptide for use in the composition. The composition is used for transfection in vitro, in vivo or ex vivo, particularly for gene therapy. A typical application is production of tumour vaccines from autologous cells transfected with a cytokine gene. The acidic peptide destabilises the endosomal membrane and significantly increases transfection efficiency, e.g. by as much as 1000 times, equivalent to that achieved with the optimal amount of cationic lipid. The acidic peptide also makes the transfection complex less sensitive to serum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A new composition has been developed for transfecting higher eukaryot cells contains: (1) a complex of nucleic acid to be expressed plus a suboptimal concentration of one or more cationic lipids, and optional at least one auxiliary lipid; and (ii) the new feature, at least one membrane-active, acidic peptide; where the ratio total positive charges:total negative charges in the composition is about 0-3,
                                                                                                                                                                                                                                        Synthetic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Composition containing nucleic acid complexed with cationic lipid and a membrane-active, acidic peptide - used to increase efficiency of transfection by destabilising the endosomal membrane, especially

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          RESULT
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  В
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              sequences were used in a transfer moiety which makes up part of the cmultifunctional molecular complex of the invention. The multifunctional complex is used for the transfer of a nucleic acid composition to a target cell, and comprises the nucleic acid composition and a curansfer moiety comprising one or more cationic polyamine components bound to the nucleic acid composition. There are several different cationic polyamines that can be used in the complex, one of which contains one of these sequences linked via a bridging group to the main composition of the cationic polyamine. The products can be used for delivering tharapeutic agents, vaccines, foodstuffs, herbicides, plant growth cregulators, insecticides, miticides, rodenticides, fungicides, and conditional against a pathogen or for treating an autoimmune disease or hyperproliferating disease. The complexes provide for a high level of calls.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Matches

charged lipid bilayer membranes composed of a cationic and/or polycationic lipid and at least one natural or synthetic viral fusion peptide integrated in, or covalently linked to, the membrane. Such peptides are used as drug delivery systems, preferably for (non-)specific delivery of genetic material to target cells or tissues, particularly for diagnosis, treatment (especially antisense treatment) of cancer, leukaemia and viral infections in humans or animals. Genetic
                                                                                                                                                                Vesicle with cationic lipid bilayer that includes viral fusion peptide - used for delivery of genetic material to cells, espe for gene therapy of cancer, leukaemia and viral infections
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The sequences given in AAR26004-19 are influenza fusion peptides, derived from the influenza virus haemaggluttnin gene which were used for the preparation of synthetic membrane vessicles. The arrangment of at least one, pref. three cystein residues at one end of these peptides has been found useful for the fusion activity, for the fusion of the liposome to the target cell membrane. The liposomes produced using these peptides can contain at least one active drug and can be used to target cells infected with cancer
                                                                                                    Peptides AAW34269-W34284 represent novel lipid vesicles with positively

The present sequence is a crosslinker which is capable of linking to the surface of a novel cationic virosome and is capable of binding polypeptides. The cationic virosome is a lipid bilayer vesicle comprising a membrane with a net positive charge and contains 5-30 weight 8 based on total lipids, 1,3-dioleoyloxy-2-(6-carboxy-spermyl)-propyl-amide (DOSPER), together with other lipids and at least one active fusogenic peptide. The fusogenic peptide is a viral haemagglutinin that causes the vesicle to be internalised by target cells through phagocytosis or substance, preferably a nucleic acid, to target cells (resting or proliferating mammalian cells) such as cancer cells, leukaemic cells or virally infected cells in vitro, in diagnostic or medical applications
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   material is delivered, without infection, to resting or proliferating cells, in vitro or in vivo. When the genetic material is an antisense molecule, it is targeted to mRNA encoding a (proto)oncogene. The continuous lipid layer does not leak. The peptides do not need to fuse with, or destabilise, plasma membranes in order to enter the cytoplasm, since the fusion peptide ensures cell penetration by endocytosis (after which fusion of the vesicle and endosomal membrane occurs). The genetic material thus has a greater chance of reaching the nucleus before it is degraded or expelled. Transfer of the material is 1000-20000 times more efficient than when using liposomes or conventional virosomes, so smaller doses can be used, avoiding possible toxicity associated with the genetic material.
                                                                                                                                                                                                                                                        Lipid bilayer vesicle, useful for delivering drugs to target cells as cancer, leukemic, or virally infected cells, comprises viral glycoproteins in positively charged membrane
                                                                                                                                                                                                                         Disclosure;

SSSS
      AAR98010-R98041 represent fusogenic peptides derived from spike classifier of enveloped viruses. These fusogenic peptides act as classifier endosome membrane disruption promoting components (EMDPCs). These sequences were used in a transfer moiety which makes up part of the complex of the invention. The multifunctional complex is used for the transfer of a nucleic acid composition to a target cell, and comprises the nucleic acid composition and a current cell, and comprises the nucleic acid composition and a composition of the nucleic acid composition. There are several different cationic polyamines that can be used in the complex, one of which contains one of these sequences linked via a bridging group to the main contains one of these sequences linked via a bridging group to the main contains one of these sequences linked via a bridging group to the main contains one of these sequences linked via a bridging growth contains one of these sequences linked via a bridging growth contains one of these sequences linked via a bridging growth contains one of these sequences linked via a bridging growth contains one of these sequences linked via a bridging growth contains one of these sequences linked via a bridging growth contains one of these sequences linked via a bridging growth contains one of the cationic polyamine. The products can be used for delivering contains one of the contains one and composition of the contains one of the main contains one of the contains one of the main contains one of the contains one of the main contains one of the contains one of the main conta

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Qy
                                                                 The invention relates to hybrid polypeptides comprising enhancer peptide sequence linked to core polypeptides. The enhancer polypeptides are derived from various retroviral envelope (9p41) protein sequences, especially from HIV-1, HIV-2 and SIV. The enhancer peptides enhance the pharmacokinetic properties such as increasing the half-life of any core polypeptide that they are linked to. The core polypeptides are any core polypeptide that may be introduced into a living system and that can function as a pharmacoligically useful peptide for the treatment or prevention of a disease. The core polypeptides are bloactive peptides selected from a growth factor, cytokine, differentiation factor, interleukin, interferon, colony stimulating factor, hormone or angiogenic factor. The peptides of the invention can be used for anti-fusogenic factor. The peptides of the invention can be used for anti-fusogenic treatments. Sequences AAX88651-Y90055 represent core polypeptide fragments that can be used in the invention. Some sequences and form hybrid polymerides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Sox

                                                                                                                                                                                                                                                                           The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107. DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-1LAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other acidor with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to inhibit HIV infection. The present sequence is a peptide provided in
                                                                                                                                                                                                                    Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Disclosure; Page 55;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to isolated analogues of the heptad repeat region peptides DP178 and DP107. DP178 and DP107 correspond to amino acids 638-673 (heptad repeat region HR2) and 558-595 (heptad repeat region HR1) respectively, of HIV-ILAI transmembrane protein gp41. The HR1 and HR2 regions of proteins interact non-covalently with each other and/or with peptides derived from them. This interaction is required for normal infectivity of viruses such as RSV and HIV. The heptad repeat region peptide analogues may be used to inhibit respiratory syncytial virus (RSV) infection in a cell. They may also be used to

                                                                                                                                                                                                                                                                                         The present invention relates to peptides which exhibit anti-retroviral CC activity. The peptides of the invention (AAUJ2559-AAUJ4009) comprise DP178-like and DP107-like peptides. The DP178 peptide corresponds CC to amino acids 639-673 of the transmembrane protein gp41 from human CC immunodeficiency virus 1 (HIV-1) isolate LAI. The DP107 peptide CC corresponds to amino acids 558-595 of gp41 from HIV-1LAI. The invention CC also relates to a method of identifying compounds that inhibit the CC formation of or disrupts a DP107/DP178 complex. The method comprises CC detecting the formation of a DP107/DP178 complex, both in the presence CC or absence of a test compound, in a reaction mixture containing DP107 cand DP178 peptides. The method is useful for identifying compounds, CC including small molecule compounds, which may themselves exhibit CC antifusogenic, antiviral or intracellular modulatory activity. The DP178-like/DP107-like peptides are useful to inhibit human and non-human CC retroviral, particularly HIV, transmission to uninfected cells. The CC of the invention.

Brown D., Churcher C.M., Wood V., Barrell B.G., Rajandream M.A.;

Submitted (JUL-1997) to the EMBL/GenBank/DDBJ databases.

-I- FUNCTION: BINDS IN VITRO TO CENTROWERES AND MICROPUBULES, IT IS A CENTROMERE DAA. CBF3 BEINDIM FACTOR AND IS INVOLVED IN MITOTIC CHROMOSOME SEGREGATION. IT IS ESSENTIAL FOR CELL GROWTH (BY SIMILARITY).

-I- SUBCELLULAR LOCATION: Nuclear; nucleolar (By similarity).

-I- SIMILARITY: BELLONGS TO THE TRUB FAMILY OF PSEUDOURIDINE SYNTHASES.
                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright.                    Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
